

## Root Beer Executive Summary

There has been a significant amount of progress being made consistently through months. There are a total of 31 source files in the Root Beer project. Most of the work is being completed in the Java source files. In particular, the file labeled

`rootbeerlib/src/main/java/com/scottyab/rootbeer/RootBeer.java` has had the most amount of commits being made to it with a total of 53 commits.

The developer of the Root Beer project that has done the most work would be Scott Alexander-Bown. Another developer that has done a lot of work is Matthe Rollings. Most of this work has improved the project by fixing bugs, spelling mistakes, and adding more functionality. The least amount of work has been committed by developers grubeli and Fi5t. These developers could have left the Root Beer project and focused on another area or project.

Below, you will find a scatterplot that helps to visualize what work is committed. You can see how often throughout the months and in which files the progress is being made. The dots are colored uniquely for each author so you can see who is doing the work.

Some of the git commands I found useful during this lab are `git status`, `git log`, and `git checkout`. I will be sure to use these commands and many others in future development.
